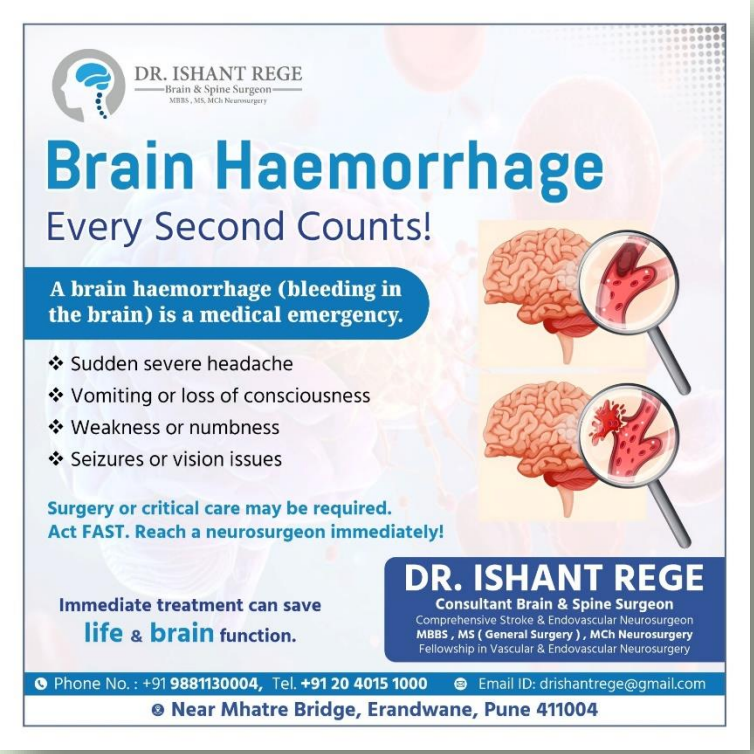
Brain Haemorrhage – Every Second Counts! | Dr. Ishant Rege, Brain & Spine Surgeon, Pune

What is a Brain Haemorrhage?



DR. ISHANT REGE
Brain & Spine Surgeon
MBBS , MS, MCh Neurosurgery
Brain Haemorrhage
Every Second Counts!
A brain haemorrhage (bleeding in the brain) is a medical emergency.
❖ Sudden severe headache
❖ Vomiting or loss of consciousness
❖ Weakness or numbness
❖ Seizures or vision issues
Surgery or critical care may be required.
Act FAST. Reach a neurosurgeon immediately!
Immediate treatment can save life & brain function.
DR. ISHANT REGE

Near Mhatre Bridge, Erandwane, Pune 411004

A **brain haemorrhage** (also called intracranial hemorrhage) occurs when an artery or blood vessel in the brain ruptures, causing bleeding inside or around brain tissue. This bleeding increases **pressure inside the skull**, damages brain cells, and can lead to permanent disability or even death if not treated immediately.

Brain haemorrhage is a **medical emergency**. Every second of delay reduces the chances of survival and brain recovery.

Symptoms of Brain Haemorrhage

Recognizing the early signs can save lives. Common symptoms include:

- **Sudden severe headache** (often the worst headache ever experienced)
- **Vomiting or loss of consciousness**
- **Weakness or numbness** (often on one side of the body)
- **Seizures or vision problems**
- Difficulty speaking or understanding speech
- Trouble walking or loss of balance

If any of these symptoms occur, seek emergency medical care immediately.

Causes and Risk Factors

Several factors can increase the risk of brain haemorrhage:

- **High blood pressure (hypertension)** – the most common cause
- **Head injury or trauma**

- **Aneurysm rupture** (weak spot in a blood vessel)
- **Blood vessel abnormalities** (arteriovenous malformations)
- **Blood-thinning medications**
- **Excessive alcohol or smoking**
- **Brain tumors**
- **Medical conditions** such as liver disease or bleeding disorders

Why Immediate Treatment is Critical

A brain haemorrhage quickly reduces blood flow to essential areas of the brain. The bleeding increases pressure inside the skull, which can lead to:

- Stroke-like symptoms
- Permanent paralysis or disability
- Loss of brain function
- Coma
- Death

Immediate treatment is essential. **Surgery or critical care may be required** depending on the severity and location of the bleed.

Treatment Options

Dr. Ishant Rege specializes in **comprehensive stroke and endovascular neurosurgery**. Treatment may include:

1. **Emergency Care**
    - Stabilizing vital signs
    - Controlling blood pressure
    - Managing brain swelling
2. **Surgical Intervention**
    - **Craniotomy** – Removing a part of the skull to relieve pressure
    - **Clipping/Coiling** – Repairing aneurysms
    - **Endoscopic Surgery** – Minimally invasive approach to remove clots
3. **Critical Care & Rehabilitation**
    - ICU monitoring for brain function
    - Physiotherapy for mobility recovery
    - Speech therapy for language issues
    - Psychological support for patients and families

How to Act FAST

When dealing with brain haemorrhage, remember: **Time is Brain**.

1. **F – Face**: Is the face drooping?
2. **A – Arms**: Can the person lift both arms?
3. **S – Speech**: Is speech slurred or strange?

4. **T – Time**: Rush to a neurosurgeon immediately!

Why Choose Dr. Ishant Rege?

- Expert in **Brain & Spine Surgery**
- Special training in **Stroke & Endovascular Neurosurgery**
- Skilled in handling **critical and emergency brain cases**
- Advanced **neurosurgical techniques** for better recovery
- Compassionate and patient-focused care
